Numerical verification of the Black-Scholes contour inverse
Direct evaluation of the finite-interval formula
Lines: known Black-Scholes prices and volatilities
Circles: contour integral, with only (k, c, T) as inputs
Implied volatility σ_{BS} (T = 1)
Forward-normalized call price c
Log-moneyness
k = 0.01
k = 0.1
k = 0.5
k = 1
Relative recovery error: 42 parameter combinations
Log-moneyness k
Known total volatility $\sigma_{BS}\sqrt{T}$
log10(relative error)
